

## 2) (10 pts) DSN (Linked Lists)

Given a singly integer linked list, complete the following user defined function definition `moveHeadNearTail`. The user defined function moves the head node of some singly linked list that is passed to the second last position of the list (the node that comes before the tail node itself). The following figure shows a sample scenario. The function returns the head of the modified linked list. **You may assume the linked list pointed to by head has at least 3 elements in it.**

Before moveHeadNearTail

After moveHeadNearTail

```
typedef struct node_s {
    int data;
    struct node_s* next;
} node_t;

node_t * moveHeadNearTail(node_t * head) {

}
```
