1) (10 pts) DSN (Dynamic Memory Management in C)

Suppose we have a stack implemented with an array as shown in the structure below. Write a function called `grow_stack` that will increase the stack's capacity while preserving the exact values currently in the stack and their current locations. Your function should take 2 parameters: a pointer to the current stack and an integer representing the amount to increase the stack's capacity by. **You may not use the `realloc` function.** You may assume `s` isn't NULL and `pts` to a valid struct stack. You may assume that `capacity` stores the current size of the array that the pointer array is pointing to and that `top` represents the number of items currently in the stack (items are stored in indexes 0 through `top-1`).

```
struct Stack {  
    int *array;  
    int top;  
    int capacity;  
};
```

```
void grow_stack(struct Stack *s, int increase) {
```

```
}
```
