2) (10 pts) DSN (Linked Lists)
Complete the following user defined function that reconstructs the structure of a singly linked list. The function will take a pointer to the head of some list along with the number of nodes `n` and move the first half the nodes to the back of the list while the other half moves up to the front. **<u>For grading purposes, please write your solution iteratively, with NO recursion.</u>** The function will return the new head of the list. **<u>You may assume that the original list has an even number of elements and is not empty.</u>** The following figure shows the scenario.

Before flipHalf   After flipHalf

```c
typedef struct node_s {
    int data;
    struct node_s* next;
} node_t;

node_t * flipHalf(node_t * head, int n) {

}
```
